

VisionExtract: AI Subject Isolation

Deep Learning-Based ImageSegmentationwith
DeepLabV3

Presented by: Puli Uma Vara Naga Durga Ujwal

The Challenge: Manual vs. AI

Manual Editing Frustrations

- Slow, tedious, and expert-dependent process.
- Complex backgrounds lead to inaccurate results.

VisionExtract: The AI Solution

- AI-powered segmentation for instant extraction.
- Consistent, scalable, and quality-driven results.

Addressing the Problem

Manual subject isolation is a significant bottleneck in many creative and analytical workflows. It demands considerable time and specialized skills, often leading to inconsistencies and errors, especially with intricate images. Vision Extract offers a transformative solution by automating this process with AI.

Core Architecture: DeepLabV3

Our solution leverages the powerful DeepLabV3 model,enhanced with a ResNet50 backbone. This architecture is specifically designed for semantic image segmentation,allowing for highly accurate subject isolation even in challenging scenarios.

Dataset and Output

The model was rigorously trained on the COCO2017 dataset, comprising 5,000 diverse images. This extensive dataset ensures robust performance across a wide range of subjects and backgrounds. The output is a precise binary mask, clearly delineating the subject from its surroundings.

COCO 2017 Dataset

- 5,000 images for training and validation.
- 80/20 split for optimal model generalization.

Precise Binary Mask Output

- Clear separation of subject and background.
- Foundation for advanced image manipulation.

Loss Function Optimization

To achieve superior segmentation accuracy, we employed a combined loss function: Dice Loss and Cross-Entropy Loss. This strategic combination, with weights of [0.3, 0.7] respectively, optimizes the model's ability to handle class imbalance and boundary details effectively.

$$Loss = 0.3 \times DiceLoss + 0.7 \times CrossEntropy Loss$$

Training Pipeline: Robust and Efficient

Our training pipeline is designed for efficiency and accuracy, incorporating advanced techniques to ensure optimal model performance and generalization. This systematic approach minimizes errors and maximizes the model's ability to learn from the data.

01

Preprocessing

Albumentations for resize, normalize, and augmentations.

02

Optimizer

AdamW with Learning Rate $2e-4$ and cosine annealing schedule.

03

Training

20 epochs with a batch size of 6, incorporating early stopping.

04

Hardware

GPU-accelerated environment for rapid and efficient training.

Performance Metrics

VisionExtract demonstrates exceptional performance across key segmentation metrics, ensuring high-quality subject isolation for diverse applications. Our model achieves a high Intersection over Union (IoU) and Dice Score, indicating precise boundary detection and overall accuracy.

86.6%

IoU Score

Intersection over Union

91.81%

Dice Score

Dice coefficient for
segmentation quality

95.31%

Pixel Accuracy

Correctly classified pixels

Applications of VisionExtract

The capabilities of Vision Extract extend across numerous industries, offering significant advantages in efficiency and quality. From e-commerce to creative design, our AI subject isolation tool provides a versatile solution.

E-commerce

Automated product image background removal.

Photography

Streamlined portrait and object isolation.

Graphic Design

Quick asset preparation for creative projects.

The Future of Image Editing

Vision Extract represents a significant leap forward in image editing technology, making advanced segmentation accessible and efficient. We are continuously exploring new enhancements and applications to further revolutionize how we interact with visual content.
